discoveries

The Polio Chaser

I remember putting out my hand as a child to receive a crisp white sugar cube which I was to crunch up and swallow, and that was the famous polio vaccine. I remember seeing children stuck in wheelchairs, their shriveled bodies curled and bent like the wheels of the chair itself, and that was polio. I remember always having to shower before getting in a public swimming pool (which protocol lingers to this day) and that was/is because of polio.

The polio story is huge. A good starter is the famous Janine Roberts piece (Google "Janine Roberts polio the virus and the vaccine") and you will learn that early cases of what was called *palsy* began to show up consistently in children who lived near farms being sprayed with chemical pesticides. This was toward the turn of the last century. Writes Roberts:

In 1892 [the arsenic-based pesticide] *Paris Green* was replaced in Massachusetts by the more toxic pesticide lead arsenate. Two years later the first recorded epidemic of infantile paralysis struck in Massachusetts' neighbouring state of Vermont.

The outbreak was investigated by Dr Charles Caverly, who reported that it was probably caused by a toxin rather than a micro-organism. Caverly said: "It usually occurred in families of more than one child, and as no efforts were made at isolation it was very certain it was non-contagious."

Lead arsenate rapidly became the principal pesticide used on fruit and berries throughout the industrial world. In 1907 calcium arsenate was introduced for use primarily on cotton crops and in cotton mills. A year later 69 healthy children suddenly fell paralytically ill in Massachusetts. They lived in a town with three cotton mills, and in settlements downstream from those mills. Nearby there were also orchards on which lead

arsenates were almost certainly in use. They were also living only a short distance downstream from the location of the Vermont outbreak.

A further epidemic in Massachusetts in 1908 caused enormous public concern, but, despite the evidence that exposure to toxins might have been responsible, the investigating health officials overlooked the newly introduced pesticides; they thought them essential to their war against viruses and bacteria—and to the financial health of the agricultural industry.

But the person who has truly expanded the polio story is Jennifer Lake, beginning on her "Polio Forever" blog (www.polioforever.wordpress.com), where you will have to skip around and read more than one or two things to get the picture, which very importantly includes not just chemicals that damage the body but radiation—yes, that word that is again flying around thanks to Fukushima and even our pocket-sized cell phones.

Did you know that the polio vaccine followed nuclear testing around the world? What Jennifer Lake seems to be saying in her new blog serial entitled "JFK Conspiracy Con" (<http://jenniferlake.wordpress.com/2011/11/06/the-jfk-conspiracy-con>) is that as part of the Manhattan Project and subsequent nuclear testing, *wherever nuclear radiation was spread a "vaccine chaser" followed*—meaning that the large number of people who became neurologically compromised as a result of radiation were offered the polio vaccine to "prevent further cases" of such harm (i.e., epidemic polio). Her spectacular phrase: "Stealing the people's health and offering to sell it back to them ..." From the JFK piece:

It is said that governments do not give up their weapons unless and until they have **better** ones to replace them. What new weapon did they have in 1963? For certain, a Peace weapon—one that would go around the world. A polio vaccine. **Stealing the people's health** and offering to sell it back to

them bit by bit does not sound like a scheme invented by an economically depressed Communist state [the USSR]. Polio vaccines like Salk's 3-shot injectables were not suitable giveaways even for a rich nation, but in 1962, Albert Sabin's oral drops were in their last stages of field trials—in, of all places, Cuba and the USSR. For the next decades to come, the Sabin OPV was the vaccine "diplomat" of choice. The Salk legacy was to move upwards and manifest as a New Frontier in a medical field being born as "metabiology." There, the common interests of the Bronfmans, Lewis Strauss, and many others merged at the Salk Institute in San Diego. Sam's son Edgar Bronfman became an anchor patron, founding funder and trustee. Lewis Strauss's friend, Dr. Leo Szilard (a father of the Bomb), and other former Manhattan Project veterans, signed on as Fellows. For medical purposes, the Salk was to take on the challenges of what health physics called "combined injury" from radiation and chemicals; birth defects, gene mutations, neurological disease, cancer and AIDS. For metabiological purposes, well ... that's another story. There's still a lot left to this one.

Social and Biological Destiny

The series is barely halfway done, and sprang from years of reading books, books and more books—some little known and some so old that they have been forgotten. One of these books was *The Molecular Vision of Life* by Lily E. Kay (Oxford University Press, 1993). Writes Lake:

Lily Kay's book, her first of only two, is scarce and expensive. A used hardcover will cost you \$300. Kay passed away in 2000 at age 53 and I wonder if her book is now appreciating like a piece of art. One suspects she was a consummate insider participating in the abstraction of scientific history. She wrote that the Rockefeller-created field of molecular biology was the incarnation of redirected eugenics which was "animated by a potent conjunction of Protestant values and technocratic visions" [p.10] making clear that its purpose was "to control biological destiny" [p.17]. To prove her point naming giants in the field with Protestant bona fides, still with great subtlety, however, like a code running through the text, Lily Kay coaxes a truer sense of 'values' from her subject than she perhaps intended. Her Protestants are tainted, weak, 'old school' and "not religious"

(a "not religious" Protestant is no Protestant at all) and these leading personalities were beholden to their advisors and collaborators. Much in the way that Kay wrote: "Scientists could now manipulate genes ... they laid claim to 'the secret of life,' it was the scientists who were Lily Kay's heroes. They were the creators and they made it all possible by devotedly navigating their special ideas through the turbulence of rough political times. The *Molecular Vision's* retrospective abruptly ends for its readers in 1955, the year that polio vaccine set a precedent in public medicine. You may guess that the social and biological destiny of mankind was at hand.

Quotes from Lily Kay's book:

A concerted physicochemical attack on the gene was initiated at the moment in history when it became unacceptable to advocate social control based on crude eugenic principles ... Time was seldom a deterrent for the visionaries of the Rockefeller Foundation ... [which] had been the main force behind the development of the social sciences in America ... [p.9]

Programmatic statements, reports, and memoranda from the various Rockefeller divisions attest that on social and ideological levels there was no fundamental separation of purpose between the heads of corporations and the leadership of the Foundation." [p.10]

From population control by methods of socio-psychobiology (think of advertising guru Edward Bernays and the many new conventions—like cigarettes and fluoride—he introduced to Americans that ultimately shattered their health), America was introduced to *metabiology* by way of radiation's powerful effects on tissues and genes. The radiation scientists were delving into a buffet of physics, chemistry, biology and genetics to experiment and observe as fast as they could. For expediency they used fruit flies, whose new generations followed each other in a matter of weeks.

Polio, Lake tells us, was the debilitating reaper that followed not only chemical exposure but also *radiation*, and the vaccines developed for it continued to compromise people's immunity. Thus they remained susceptible to future sickness, often neurological but sometimes in the form of autoimmune disease or cancer. Many who have read up on polio know that the Salk vaccine didn't stop the disease at all—in fact, more polio showed up wherever the stuff was

sent. Today we have all kinds of new afflictions that experts say they don't know the origins of (see <http://polioforever.wordpress.com/the-polio-like-diseases>), many of which are neurological—Parkinsons, MS, ALS; some of which are autoimmune conditions—fibromyalgia, chronic fatigue; and some of which are flu-like and regularly occur where polio shots are given.

What Is the Polio Virus?

We have all been told that polio was spread by the polio virus, and yet many conspiracy theorists insist there was no polio virus. I have learned—with much confusion because this is not an easy lesson—that there *is* such a thing as “polio virus,” but it is not a little wiggly that hangs around swimming pools and causes the disease. As Jenny Lake has patiently tried to educate me and my head has spun from the complexity of it all, I now get it that viruses are chemical sequences formed by and in the body itself (*endogenous* viruses; but there are also *exogenous* viruses occurring not-in-the-body) and when the polio condition hits—whether you want to call it polio or something more modern—your body creates these chemical sequences, otherwise known as viruses, in response to it.

What does the body do with the viruses it makes? When radiation enters the cell, the energy it holds literally explodes the cell, creating debris. Viruses, as part of our own defense arsenal, are chemical agents that serve to clear such debris, as the splintered parts of the cell can re-form into undesirable organic material.

What the polio geniuses did in the 1950s was to build these chemical sequences into the polio vaccine, along with a very aggressive kind of cancer cell (the HeLa cell) and SV40 (the “monkey virus” that altered genes), which together formed a potent cocktail that made it possible for transmission/generation/expression [of new genetic material] as well as inserting a tagging mechanism (SV40) for those who had been given the vaccine. And all this was part of the famous Manhattan Project: radiation biology unfolding from fruit-fly studies into human populations.

The distorted conspiracy story circulating around the polio vaccine is that it “gives you cancer” and was designed to do so, but the real purpose of the HeLa cells (named after one Henrietta Lacks) was to include an aggressive type of cell that kept reproducing (“infinite cell line”), which is what cancer is – a cell that goes on dividing in a mad effort to preserve itself. Henrietta was a cervical-cancer patient at Johns Hopkins University in 1951, whose out-of-control tumor was just what the medical elite were looking for and

whose cancer cells were sent to the top labs to be studied. Eventually the Tuskegee Institute created a special “factory” to produce the HeLa substrate for use in polio vaccines. From Jenny Lake’s PolioForever blog:

Pleomorphism (or polymorphism) determines that life arises from chemistry: the chemical constituents of the environment composing a dynamically flexible matrix for life forms to adapt and display ‘transitional’ qualities, altering the nature of microbial form and function in an ultimately wholistic gestalt of biology. Modern pleomorphism was born in the mind of Antoine Bechamp and expressed by Claude Bernard’s conception of ‘bioterrain.’ Bechamp endured the academic tribulation of increasing marginalization as his work went unfunded and Germ Theory was promoted in politically well-connected circles. The static proposition of germ-caused disease undergirded an ancient phobia that coalesced with the 19th-century obsession among western intellectuals with ‘degenerate’ humanity: it was a sociological Perfect Storm that led to “negative eugenics.” By contrast, pleomorphic ideation was like a lifeboat idly strapped to the deck of the Titanic. Few appreciated its utility, except for those who understood the titanic Germ Theory would [someday] sink.

Germ theory held for a while and convinced us to use more chemicals in our daily lives to fight them. It is now second fiddle to “virus theory,” which is not entirely bogus as our bodies are rapidly producing viruses in response to dozens of environmental stressors (not germs but rather chemicals, radiation and electromog). What is bogus is that these are *exogenous* viruses—strains of whatnot wafting around waiting to make us sick. We are actually factories of *endogenous* viruses, chemicals that with the help of environmental radiation are pushing us forward into metabiology. And that is the dream of the nuclear age. From Lake:

90,000 commercial chemicals, gene-destabilizing radiation and 150 years of conditioned social science later, we stand at our own crossroads. Scientists have the means and the will to “build better humans.” The issues are matters of utility. Weapons and Germ Theory have proved out the degenerate lot of the human species. The Nuclear Age’s baby-boom generation is mature: though yesterday’s polio children are in their golden years, Americans would probably not survive

another assault of the kind perpetrated in the 1950s. Our bodies are more fragile. The fallout from atomic bombs has been estimated to be equivalent to 40,000 Hiroshima-sized blasts, or 16 kilotons of deadly poisons 40,000 times over. It came down with the snow and rain, grew up with the grasses and trees, and the cycle is repeating itself with chemtrails as we shift from nuclear to nanotech, biologically speaking. Nuclear energy is not going away. In fact, more is planned, and the medical-research hierarchy is devising ways of reconfiguring DNA to become radiation resistant.

Mass Chemotherapy

The importance of the polio vaccine, Lake emphasizes, is that *it was given during a period of fallout* – in fact, the world was cresting toward peak fallout, the worst period running from 1957 to 1964. Doling out a vaccine containing genetic material to populations in a state of heavy immune-system load (the effect of radiation exploding their cells) pretty much guaranteed that they would not be able to reject this new genetic information. What people got then, through the polio vaccine, was chemotherapy. Certain vaccines were developed and actually held in reserve until nuclear testing began, at which point they were introduced, promoted and heavily administered, especially to children (whooping cough and TB as examples).

So, to sum up, polio was not only the epidemic result of widespread radiation, the vaccine created for it was a cover-up for the human damage caused by nuclear testing, and the more polio that occurred where the vaccine was shipped only increased the need for more vaccine. In addition, the gene-altering materials contained in the polio vaccine, helped by aggressive self-replicating cell lines (the cancer element) catapulted human beings into a lifelong state of compromised immunity and a plethora of mysterious disorders with brand-new names that are all actually part of the grand polio spectrum.

Let's mosey on into another fascinating part of this rabbit hole. The picture of politics in the early 1960s, from Jennifer Lake's blog:

Nelson Rockefeller was the man Kennedy expected to be running against in the 1964 presidential campaign. Privately, he was having Rockefeller and the family's foundation investigated. It's likely that the Kennedy men learned what Ernest Lawrence knew: "if it hadn't been for the Rockefeller Foundation, there would

have been no atomic bomb." [p. 219, *The Molecular Vision of Life*, by Lily E. Kay. ... They would have learned that the Rockefeller Institute for Medical Research (RIMR) had an iron grip on polio research from its inception in 1901. They would have known all about Rockefeller's role as the acting head of the Department of Health, Education and Welfare in 1953 when the Salk vaccine field trials were authorized. Of course, they would have known about the Quantico sessions in 1955 when Rockefeller sponsored his 'brain trust' to design an offer on arms limitations that the Soviets would never accept, provoking an escalation that came to be called Mutually Assured Destruction (MAD). Rockefeller was Special Chief of Psychological Operations then. At the same time, in the 1950s, "Rockefeller took it as his mission to breathe new life into the moribund Atoms for Peace initiative. In that regard, it certainly did not hurt that he had a long-standing relationship with [Lewis] Strauss, who as a Kuhn, Loeb partner, had been one of the Rockefeller brothers' financial advisers."

...
Some time after the Cuban Missile Crisis [October 1962] Kennedy said to the press, "I am haunted by the feeling that by 1970, unless we are successful [at negotiating a nuclear treaty], there may be ten nuclear powers instead of four, and by 1975, fifteen or twenty... I see the possibility in the 1970s of the President of the United States having to face a world in which fifteen or twenty or twenty-five nations may have these weapons. I regard that as the greatest possible danger..." [p. 477, *President Kennedy: Profile in Power*, Richard Reeves]

A year earlier, in September of '61, after the Soviets had disregarded a voluntary moratorium and detonated the largest ground-based 'atmospheric' nuke ever designed: "in meetings with scientists, he asked ... about radioactive fallout. 'Where would we be if testing had continued at the 1958 rate?' he asked Dr. Charles Dunham, director of the Atomic Energy Commission's Division of Biology and Medicine. 'Civilized man would have been in trouble,' Dunham said. 'How does the radioactive fallout get to the earth?' he asked his science advisor, Jerome Wiesner. 'The clouds are washed out by rain,' answered Wiesner. Kennedy looked out ... into the garden. It was a rainy day and he asked: 'You mean it's in the rain out there?' 'Yes,'

Wiesner said ... Kennedy did not speak for a long time.”

JFK: Profile in Obedience

The players in this game, which is still being played in full force today, were not just the medical elite but also the gunrunners in finance and world politics. JFK, Lake believes, was groomed by world banking powers to be an ascending star and captain of America's new nuclear-testing program. A super-player by the name of Lewis L. Strauss of the financial behemoth Kuhn, Loeb was one of the architects of American nukes and of JFK's life. Writes Lake:

His greatest role in government was to ultimately oversee the fullest use of nuclear arms and development, both behind the scenes as a Kuhn Loeb banker and a direct instrument of proliferation (in the guise of its most ardent watchdog). In the specific organization of necessary elements to steer the successful execution of JFK's assassination, no one appears more essentially vested and qualified than he.

In his biography, *Men and Decisions*, Strauss (acting as though he were a nuclear-testing watchdog, as Lake points out) writes:

“I turned to my friend Detlev Bronk, the president of the National Academy of Sciences ... so that [a new study] independent of government ... was undertaken. It occupied the time of more than a hundred scientists.’ ... *The Biological Effects of Atomic Radiation*... [was] completed by June 1956 ...and it contained what was at the time rather surprising information. For example, the present dangers from ionizing radiation were found to be due much more to the excessive use of medical and dental X-rays than from fallout ... if correct, [it] would mean that our hospitals and medical laboratories are more dangerous than fallout... [The report states:] ‘The fallout from weapons testing has, so far, led to considerably less irradiation of the population than have the medical uses—and had therefore been less detrimental.

It was the usual cover-up: *Your average dentist's office is more dangerous than the worldwide tests we are doing for nuclear bombs!* Lake's blog continues:

Kennedy believed what he was told, that nuclear bombs were being detonated with no radioactive

fallout. Presumably, the ink on Strauss's manuscript was still wet when JFK announced to the nation on September 5, 1961: “In view of the continued testing by the Soviet government, I have today ordered the resumption of nuclear tests, in the laboratory and underground, with no fallout.” [p.226, *President Kennedy, Profile in Power*, Richard Reeves] What is more, Reeves informs us that the first thing Kennedy did after meeting Khrushchev was to have “secretly ordered preparations to resume testing ... [and then] ordered the paperwork ... withdrawn, so he would have the option of saying he had made the decision later than he actually had.” [p.224] Strauss was obviously not writing to influence policy as some out-of-power bureaucrats might do. The policy was all in place, and Kennedy followed it.

The Manhattan Project was an octopus, the body of which concealed the heavy-hitters who controlled the world, and the tentacles of which stretched into money, medicine, military and more. The names profiled and detailed in Lake's blog exploration *The JFK Conspiracy Con* are some we have heard of (Sam Bronfman) and some we have not (L.L. Strauss, for instance). It is a fascinating ramble that leaves you drawing your breath and shaking your head. Who would have known that biology and bombs could be related and intertwined so as to have set us all on the path toward permanent alteration? Who would have known that a vaccine meant to “save” us was part of a political/military plan to embed our cells with chemobiological substrates they could not reject and to tag us with traceability for further observation? Who would have known that the pink dust little children drew pictures in that had landed on their family cars in Nevada would blow all over the country and would irreparably explode immune systems, providing the perfect “clean slate” for the rewriting of everyone's biology? Who would have known ... ?

It leaves you wondering for a long time about what you really are, what is really going on inside you, and how that relates to what is happening today. In a recent conversation with Jenny Lake, I heard her muse that nanotech is the new extension of the Manhattan Project plan: that the nano building blocks in our bodies, which are being steadily deposited and introduced by way of various large-scale programs (chemtrails being one), will be exactly what our bodies will require in the way of intervention mechanisms to “rebuild” ourselves from the damage we are and have been suffering for decades. We will not even be able to survive without nanotechnology coursing around inside us, acting

like Santa's elves repairing and reorganizing cells and tissues. We will be praising the Lord for the good fortune of having wondrous modern science at hand to fix what has gone wrong – the kind of fixing that nature itself cannot do. *We will need nanotechnology for our survival.*

Delusions of Imaginitis

News: The CDC has announced Morgellons sufferers to be once and for all delusional. (<http://www.activistpost.com/2012/01/cdc-calls-morgellons-nanoworms-delusion.html>). A person with Morgellons who was contacted by the news networks to comment on the CDC report, which basically stated that its \$600,000 budget and the world's largest forensic database could not help in identifying the nature of Morgellons fibers and that all those who are afflicted with the syndrome have overactive imaginations ... this person (with whom I have communicated for some years and who pretty much knows the Morgellons community and who is not insane and completely credible herself) observed to me that the individuals examined by the CDC, supposedly whittled down from a long list of Morgellons sufferers, are individuals *no one in the community* has heard of or personally knows ... Hmmm! Most curious indeed.

The world's largest forensic database coupled with a dubious and suspicious sample pool would certainly add up to a big unknown and the common-sense conclusion that there's nothing to be concerned about – it's an inflammation of the imagination – all made up! Is this not like telling us, *"Your average dentist's office is more dangerous than the worldwide tests we are doing for nuclear bombs!"* Here's how upside-down it gets: The ABC reporter asked this very sensible and credible Morgellons sufferer/researcher if she thought Morgellons came from aliens, to which she replied: "Not unless the black-op government labs are scraping it off the space shuttle." And the report on ABC informed everyone that this Morgellons victim thought Morgellons was from aliens. You just can't make them do their job right, can you?

The beat goes on. We are stifled when we try to talk, show and explain things to the world, and the world is told there is absolutely nothing to worry about, the agencies are all doing a great job looking out for us. In the meantime, nanowiggles are having a field day inside us and there isn't a thing we can do about it ... most of us can't even feel them, see them and don't even know about them. All we have at our disposal, it would seem, is that "active imaginitis" – that place within our beings that is greater than who we are in our physical dimensions. I always go back to this. Some call it God, others call it Higher Power, and a very few believe

it is simply part of the Self. Nonetheless, we find ourselves trapped in this three-dimensional world with its dying trees and capsizing life forms, all of us struggling for comprehension, survival and well-being. Even the mainstreamers, the Sheeple, know something is now very wrong, and even sports and new movies can't fix it.

What can? I would guide you to the sixteenth chapter of Nancy Banks' book – if you only read it once, read it again! I would guide you to form a small group to discuss what is now our reality and maybe a true brainstorming will be born. Sitting alone in our houses thinking about this and worrying when we wake up during the night is not the way to liberty. It struck me the other night that if indeed the third dimension is controlled by darkness that exceeds our capacities and us – its prey – then we all came here to this planet where this experiment is being carried out *to find each other*. Could that be the case? A quote:

We are so used to this darkness that we mistake it for reality. We cannot recognize light because we believe the darkness is light. This makes for a very upside-down world. People who exploit separateness are called successful: those who make war are immortalized in bronze or marble. This is living in pitch darkness ... and calling the darkness day. Those who really see are those who forget themselves completely in living for the welfare of all. – Eknath Easwaran: *The Bhagavad Gita for Daily Living*

It also struck me that if, as they say, the physical world we live in is an illusion, then you could say it this way: *The thought is the reality; the physical is the illusion*. How does that strike you? It gives me a feeling of great strangeness, of a dawning kind of feeling that *this* is how it all got upside down, through the collective creation of mass thought, mass belief, cleverly fed and nourished by dark magicians.

I will leave you on that notion ...
